

# Wipro Enterprise Digital Workspace Program

## Project Work

Your 6<sup>th</sup> Sem project has been divided into **12 units** that you are supposed to perform as part of Capstone project in your lab environment and provide the **documentation** as outcomes of your tasks.

### .Unit-1 VM Installation & Configuration

- **Choose a Virtualisation Platform:** VMware Workstation, Hyper-V, or Oracle VirtualBox.
- **Create a New Virtual Machine:** Assign appropriate CPU, RAM, and disk space as per application requirements.
- **Install Windows 10 or 11:** Download the correct edition (Pro, Enterprise, etc.) from official sources, mount the ISO, and proceed with installation.
- **Apply Updates:** Install all available Windows updates to ensure the OS is current and update all installed app using “winget”
- **Standardise the Environment:** Remove unnecessary applications and features to keep the system clean for packaging.
- **User Management:** Create an user and give administrative privilege.
- **Security with Registry** – Use registry tweak

### Unit-2 Snapshot Creation for Rollback

- After configuration of a machine with OS, create a snapshot or checkpoint using your virtualisation software.

Steps of VMware user – Tab VM -> Snapshot -> Take Snapshot

- Clearly name your snapshot for easy identification.
- Make some changes with permission, software, etc at the machine which snapshot has been created.
- Now, roll back your machine using snapshot.
- This enables reverting the VM to a known state after each packaging or testing cycle, ensuring consistency.
